Media ACcess MAC

- **Prevention of collisions on the medium**
 - Fair and efficient bandwidth allocation
- **MAC for WSN**
 - Regulates sleep cycles for participants
 - Reduces waiting time for active reception
- **Standard protocols are not applicable for WSN**
 - Energy efficiency and sleep times must be added

MACA and WSN

► MACA:

- Channel must be monitored for RTS and CTS
- Nodes waking up can disrupt existing communications

—D ► Solution in IEEE 802.11:

- Announcement Traffic Indication Message (ATIM)
 - prevents receiver from starting a sleep cycle
 - informs about upcoming packages
 - is sent within the beacon interval
- When no message is pending, then the client can switch off its receiver (for a short time)

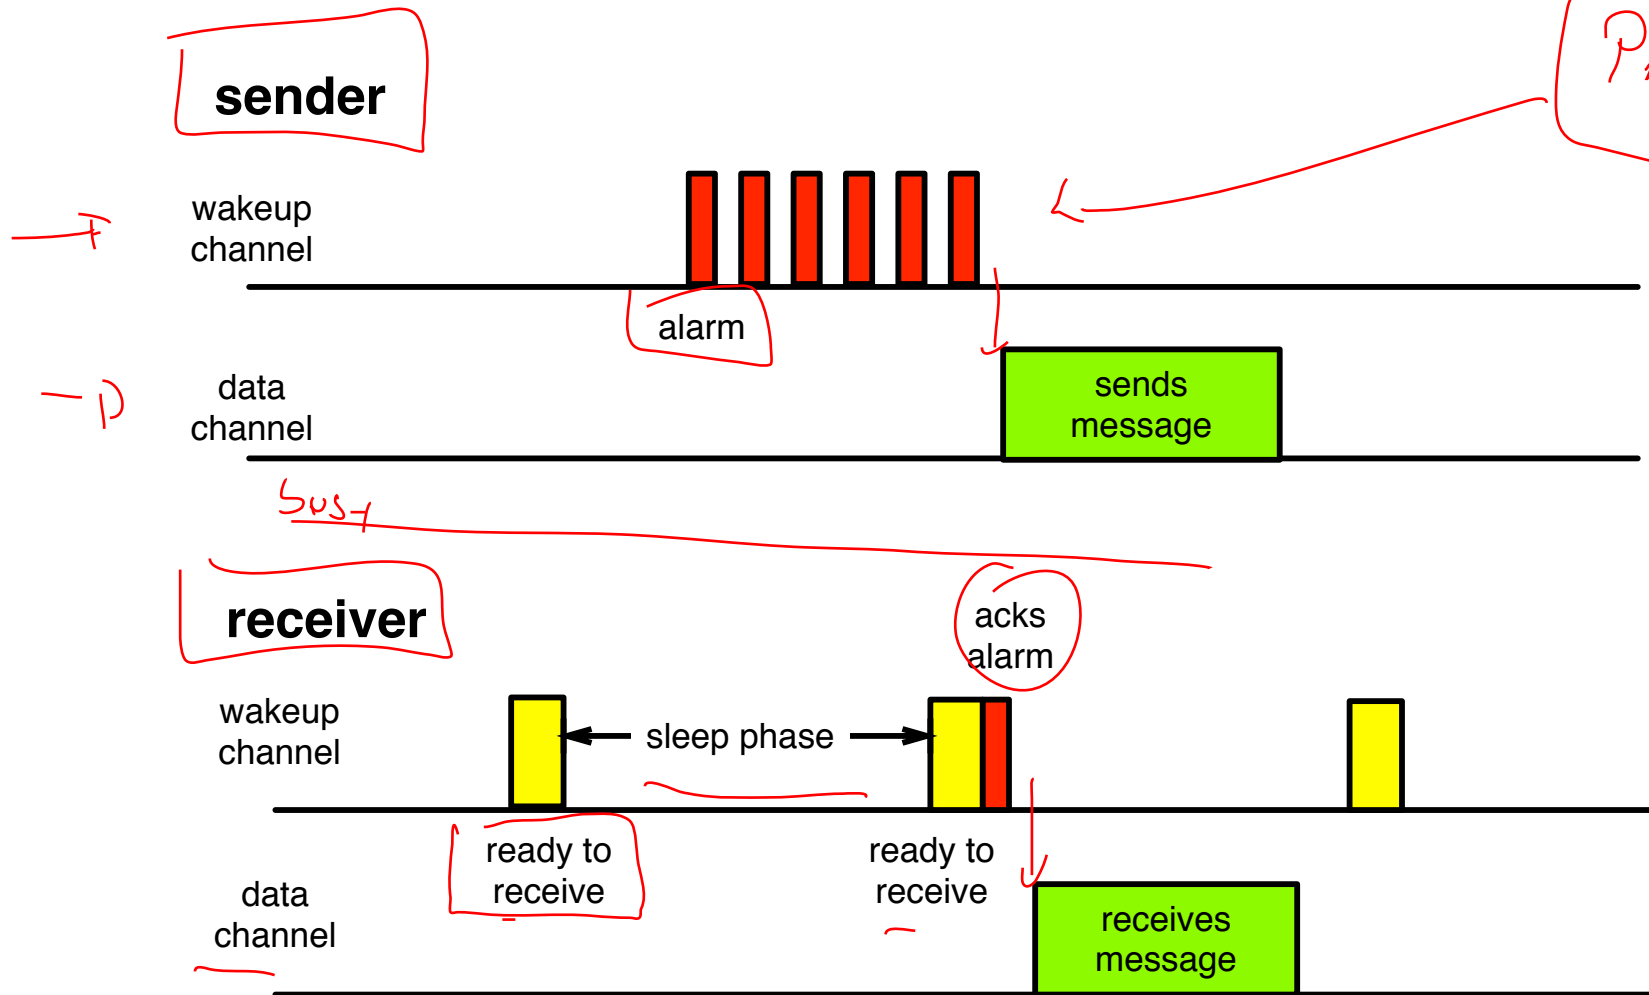

STEM

- ▶ **Schurgers, Tsiatsis, Srivastava**
 - STEM: Toplogy Management for Energy Efficient Sensor Networks, 2001 IEEEAC
- ▶ **Sparse Topology and Energy Management (STEM)**
- ◉ **Special hardware with two channels**
 - Wakeup channel ↗
 - data channel ↗
- ◉ **no synchronization**
- ◉ **No RTS / CTS**
- ◉ **Suitable for decentralized multi-hop routing**

Preamble Sampling

busy

busy

STEM

Sparse Topology and Energy Management Protocol

▶ Wakeup channel

- sender announces message
- announcement will be repeated until the receiver acknowledges
- receiver sleeps in cycles

▶ Data channel

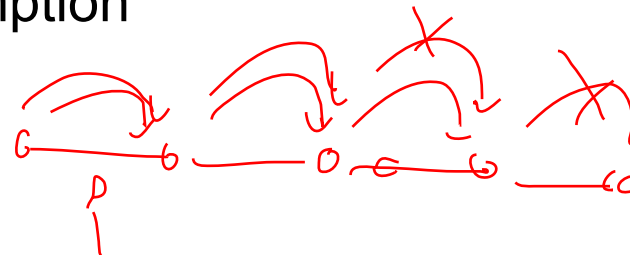

- is used for undisturbed transmission

▶ No RTS / CTS

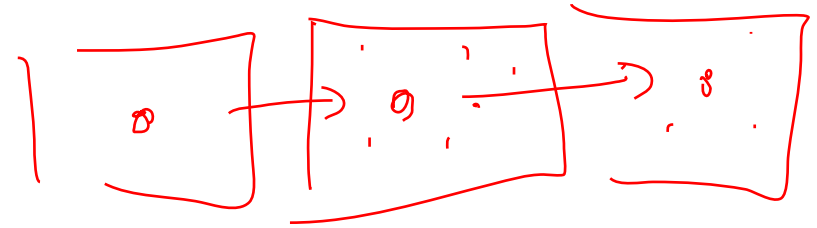

▶ No carrier sensing

Discussion STEM

- ▶ Sleep cycles ensure efficiency in the data reception
 - longer cycles improve energy efficiency
 - but increase the latency
- ▶ Too long sleep cycles
 - increase the energy consumption at the transmitter
 - lead to traffic congestion in the network
- ▶ Lack of collision avoidance
 - can result in increased traffic because of long waiting times
 - increase energy consumption

STEM

► STEM

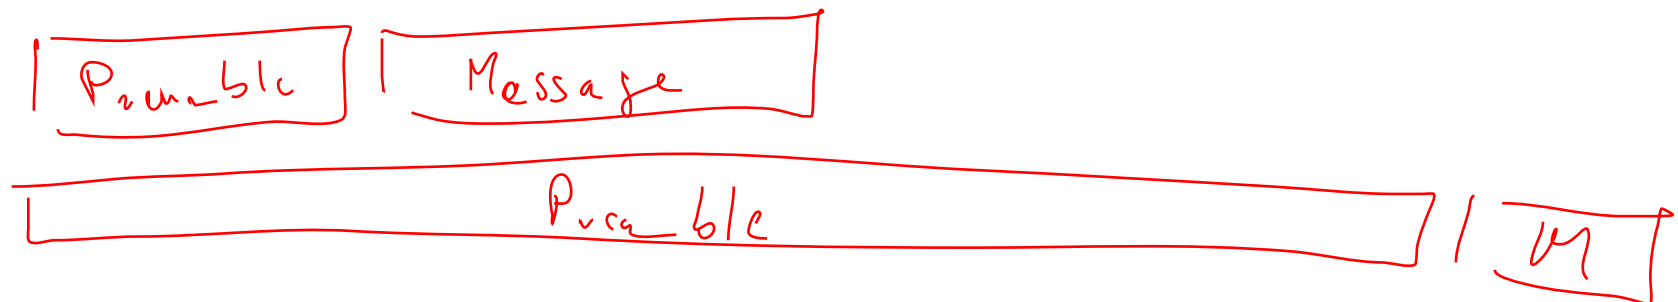

- can be combined with GAF (Geographic Adaptive Fidelity)
- GAF reduces the sensor density, by allowing only the activation of one sensor in a small square

► T-STEM

- STEM adds a busy-signal channel to wake up and to prevent communication from interruption

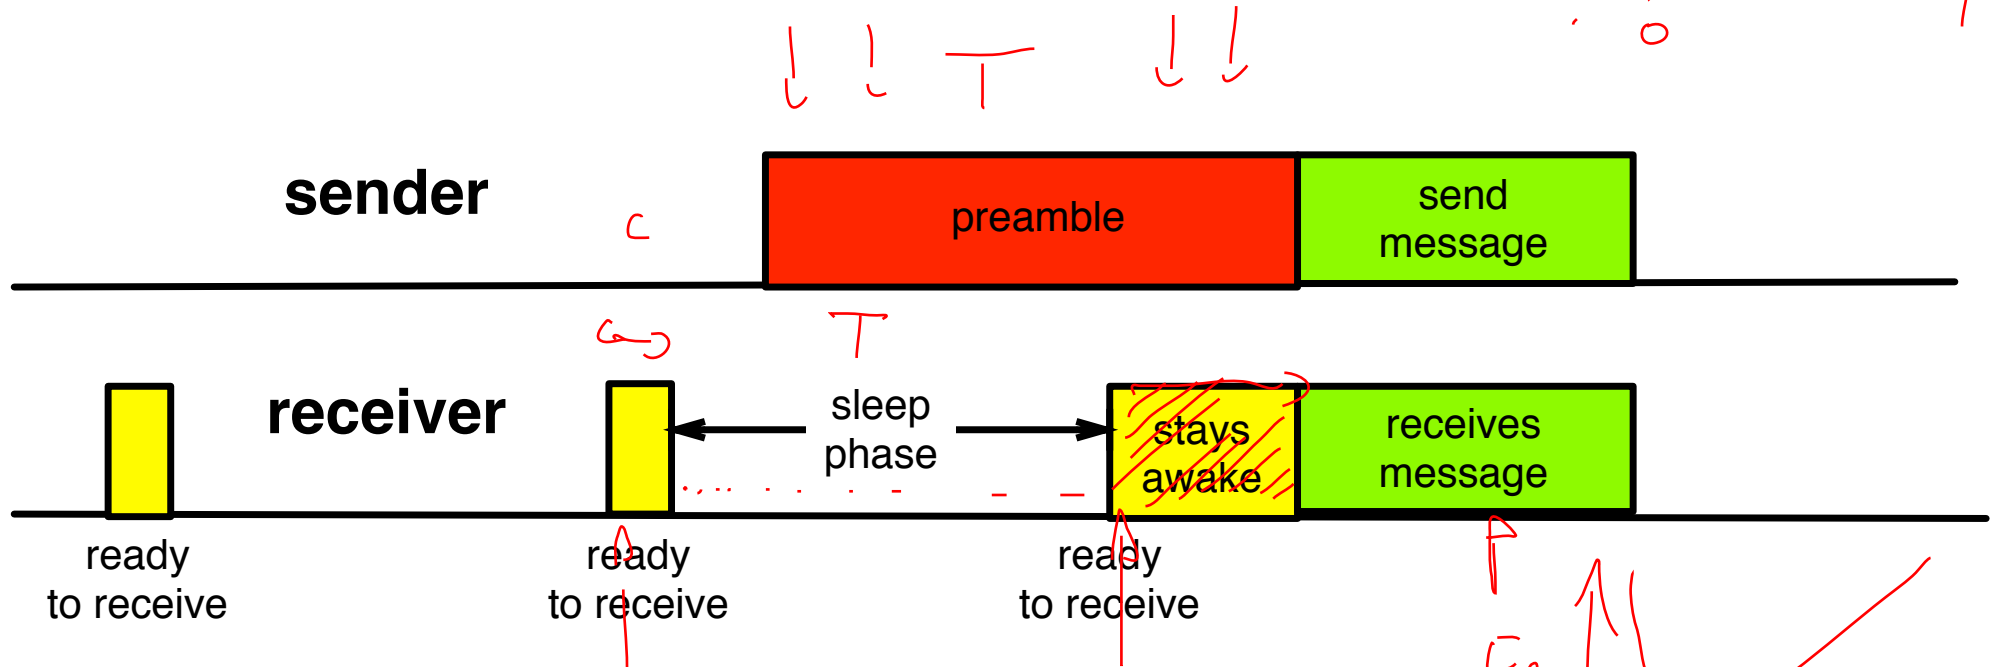

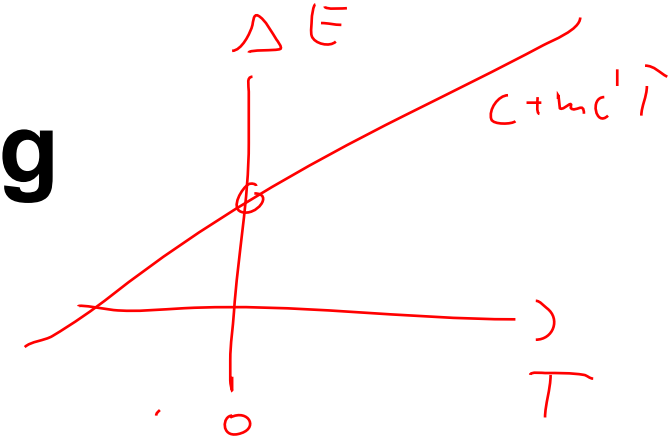

Preamble Sampling

- Only one channel available and no synchronization
- Receiver
 - wakes up after sleep period
 - listens for messages from channel
- Sender
 - sends a long preamble
 - and then the data packet

Preamble Sampling

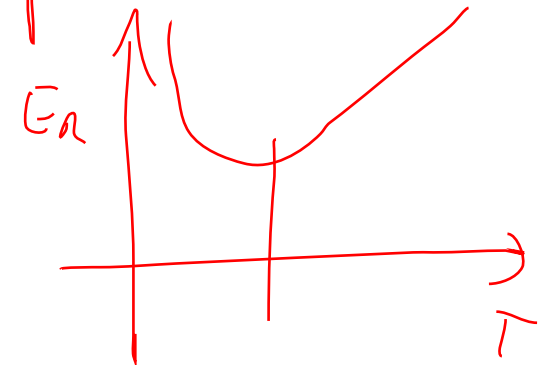

$$\underline{E_{msg/s}} = c + m \cdot T \cdot c'$$

$$E_{msg/r} = \frac{c}{T} + c' + c'' \cdot T \cdot m$$

P

P depends on traffic

Efficiency of Preamble Sampling

► Few messages

- Better: long sleep phases
- Receiver consume most of the total energy

► Many messages

- Short sleep phases
- Sender consume most of the total energy
- We observe for preamble time T and some positive constants c, c', c'' :

$$\text{Energy} = \underset{m}{c}T + \frac{c'}{T} + c''$$

$$m c = \frac{c'}{T^2}$$

$$T^2 = \frac{c'}{c m}$$

$$T = \sqrt{\frac{c'}{c m}}$$

$$\frac{dE}{dT} = m c - \frac{c'}{T^2} = 0$$

$$T = \sqrt{\frac{c'}{c m}}$$

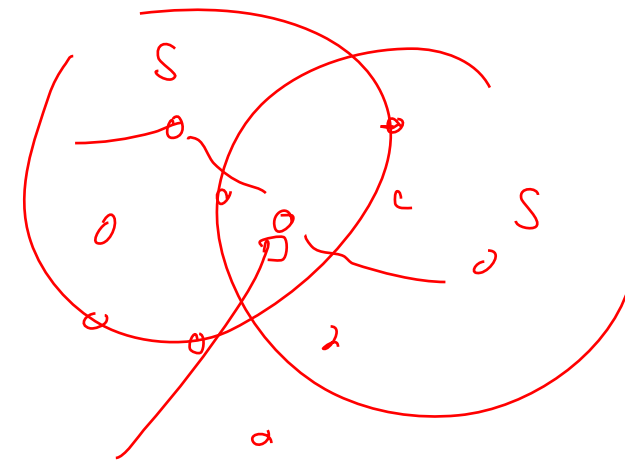

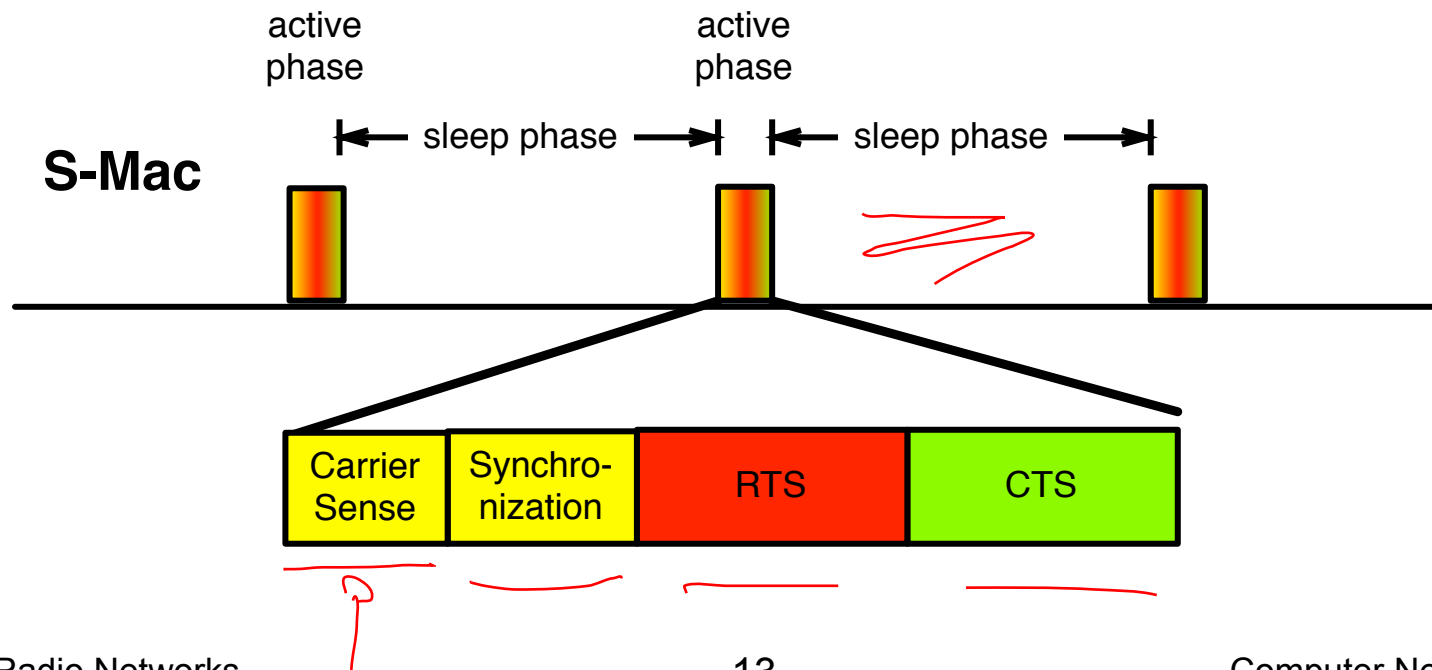

Sensor-Mac (S-MAC)

- ▶ **Ye, Heidemann, Estrin**
 - An Energy-Efficient MAC Protocol for Wireless Sensor Networks, INFOCOM 2002
- ▶ **Synchronized sleep and wake cycles**
- ▶ **MACA (RTS / CTS)**
 - for collision avoidance
 - and detection of possible sleep cycles

S-MAC Protocol

► Active phase

- Carrier Sensing
- Send Sync packet synchronizer short sleep duration with ID and
- Interval for Request to Send (RTS)
- Interval for Clear-to-Send (CTS)

$$\frac{3.6 \text{ s}}{3,600 \text{ s}}$$

$$= \frac{1}{1000}$$

$$= 1000 \text{ ppm}$$

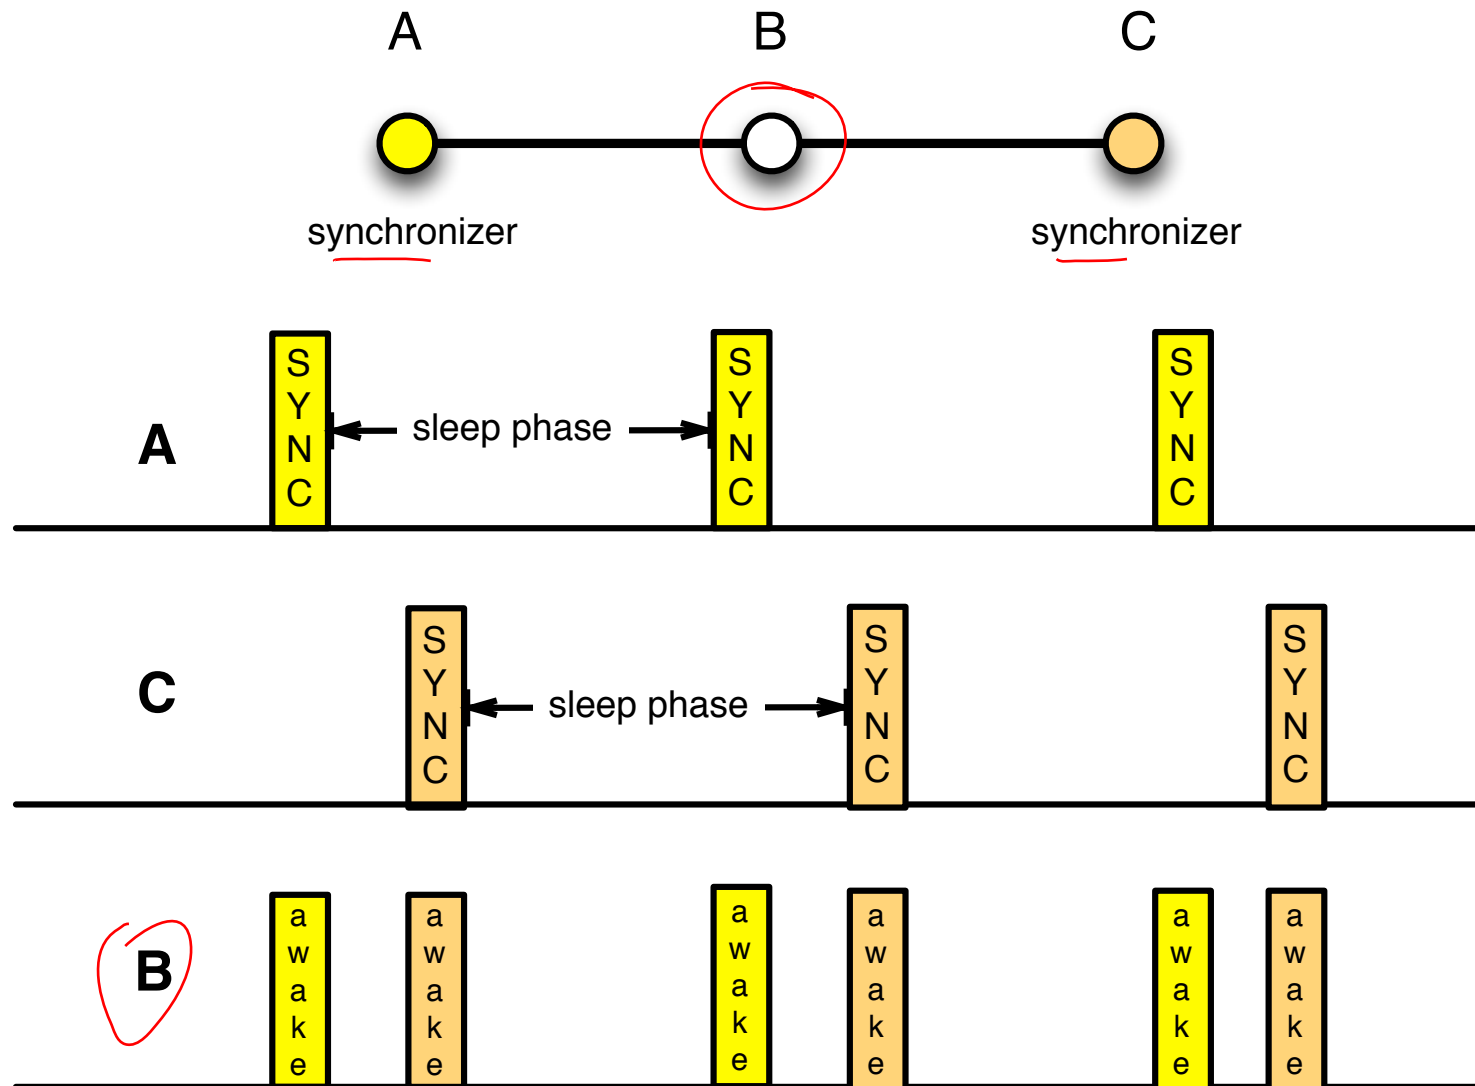

$$\rightarrow 270 \text{ ppm}$$

$$\rightarrow 50 \text{ ppm}$$

Schedule

- ▶ **Each node maintains Schedule Table**
 - with the sleep cycles of known neighbors
- ▶ **At the beginning listen to the channel for potential neighbors**
 - the sender adapts to the sleep cycles of the neighbors
 - if several sleep cycles are notices, then the node wakes up several times
- ▶ **If after some time no neighbors have been detected (no sync)**
 - then the node turns into a synchronizer
 - and sends its own Sync packets

Synchronized Islands

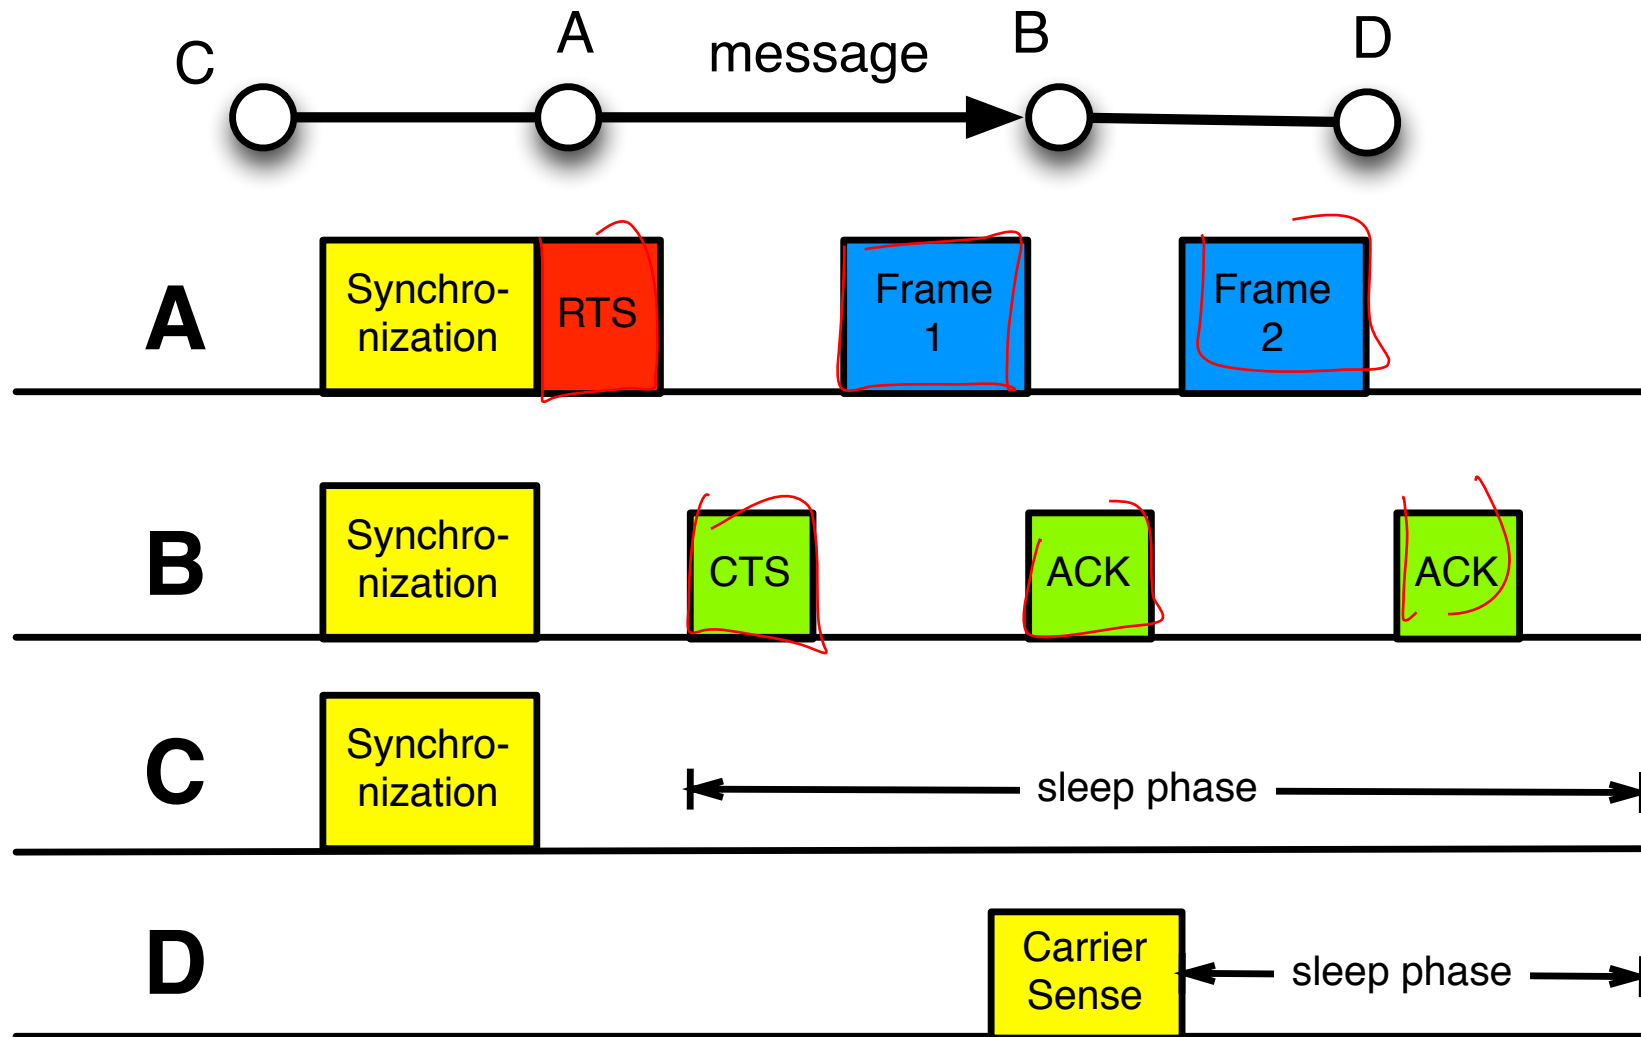

Message Transmission

- ▶ **If a node receives RTS for a foreign a node**
 - then he goes to sleep for the announced time
- ▶ **Packet is divided into small frames**
 - be individually acknowledged with (ACK)
 - all frames are announced with only one RTS / CTS interaction
 - If ACK fails, the packet is immediately resent
- ▶ **Small packets and ACK should avoid the hidden terminal problem**
- ▶ **All frames contain the planned packet duration in the header**

Message Transmission

S-MAC

Timeout-MAC (T-MAC)

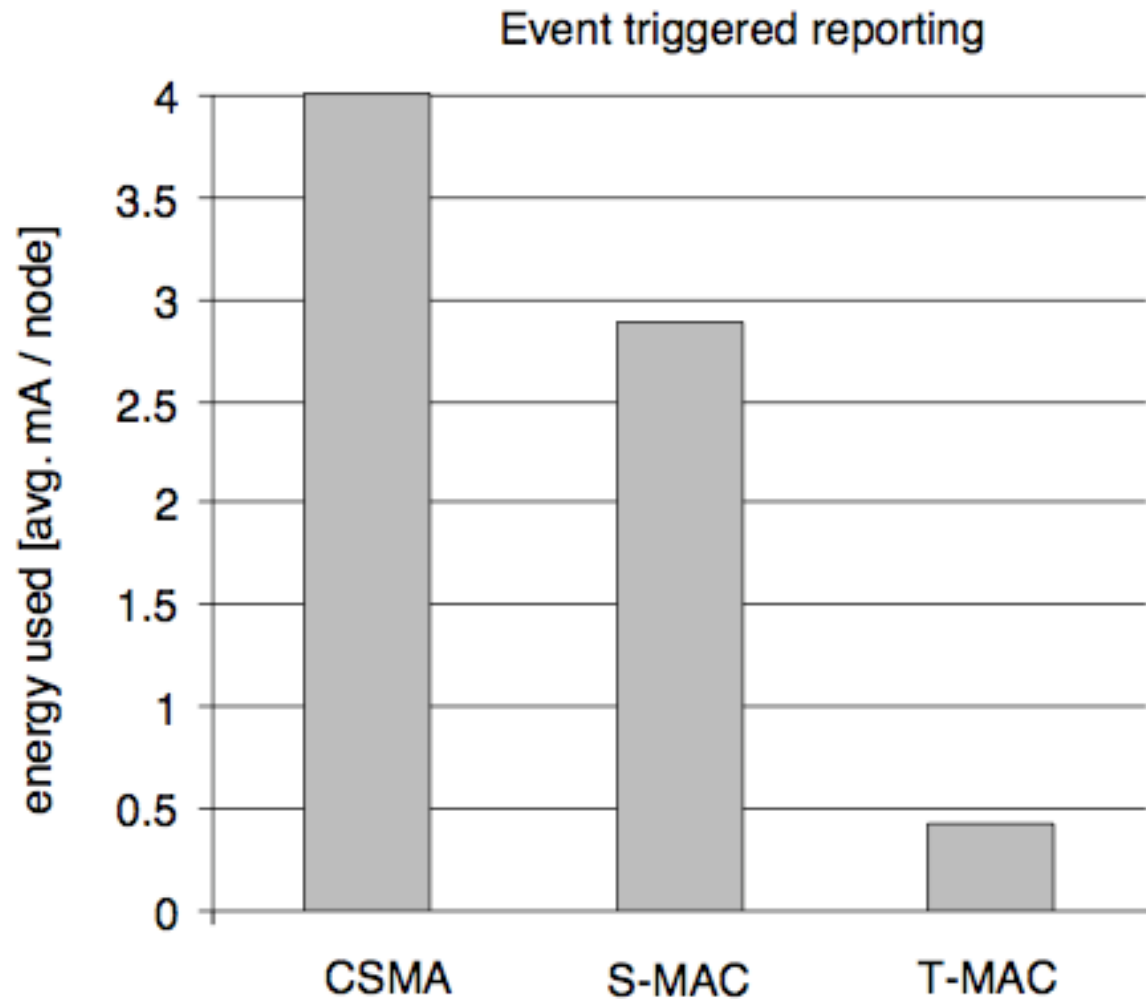

- ▶ **T. van Dam, K. Langendoen**
 - An Adaptive Energy-Efficient MAC Protocol for Wireless Sensor Networks, SenSys 2003
- ▶ **Main goal**
 - extension of the MACA-protocol to save energy
- ▶ **Method**
 - Traffic dependent sleep cycles
 - New: FRTS-Signal (Future Request to Send)
 - informs about future message
 - Allows adapted sleep phases of the receiver

Diagram illustrating a network topology with nodes A, B, C, and D. A message is sent from A to B. A collision occurs between B and C. Another collision occurs between C and D. Red handwritten annotations include a circle around node A, a circle around node C, and a large red oval around the collision between C and D. Below the oval, the text "FRTS" is written in red.

Comparison of S-MAC and T-MAC

- ▶ **FRTS solves problems that are increased by adapted sleep cycles**
 - e.g. Early Sleeping i.e., Falling asleep because sender is blocked by foreign CTS
- ▶ **Simulation indicates significant energy reduction**
 - also improve the throughput

B-MAC

► Polastre, Hill, Culler

- Versatile Low Power Media Access for Wireless Sensor Networks, SenSys'04, November 3–5, 2004, Baltimore, Maryland, USA.

► B-MAC (Berkeley-MAC)

- no synchronization
- Clear Channel Assessment
- Evaluation of RSSI compared to noise
- Hardware-oriented implementation
- Very simple, low memory and power consumption

B-MAC

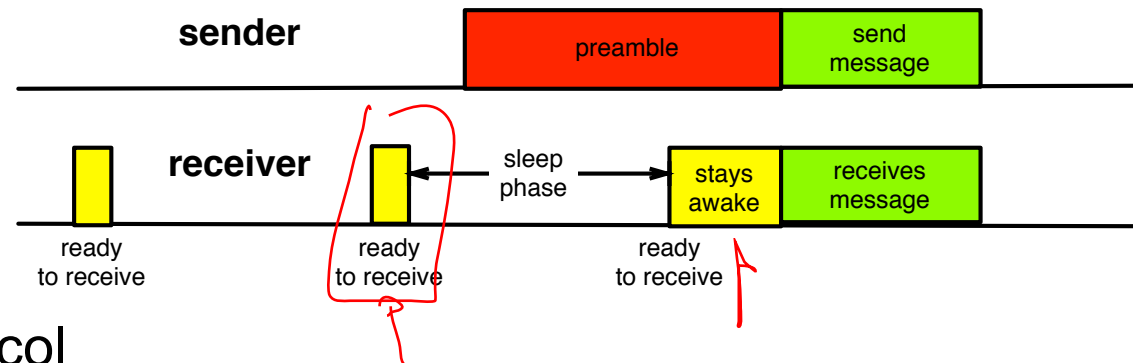

► Low Power Listening

- Preamble Sampling
- Special wake-up protocol
- adapted to hardware with low power consumption
 - Node goes into sleep mode after test

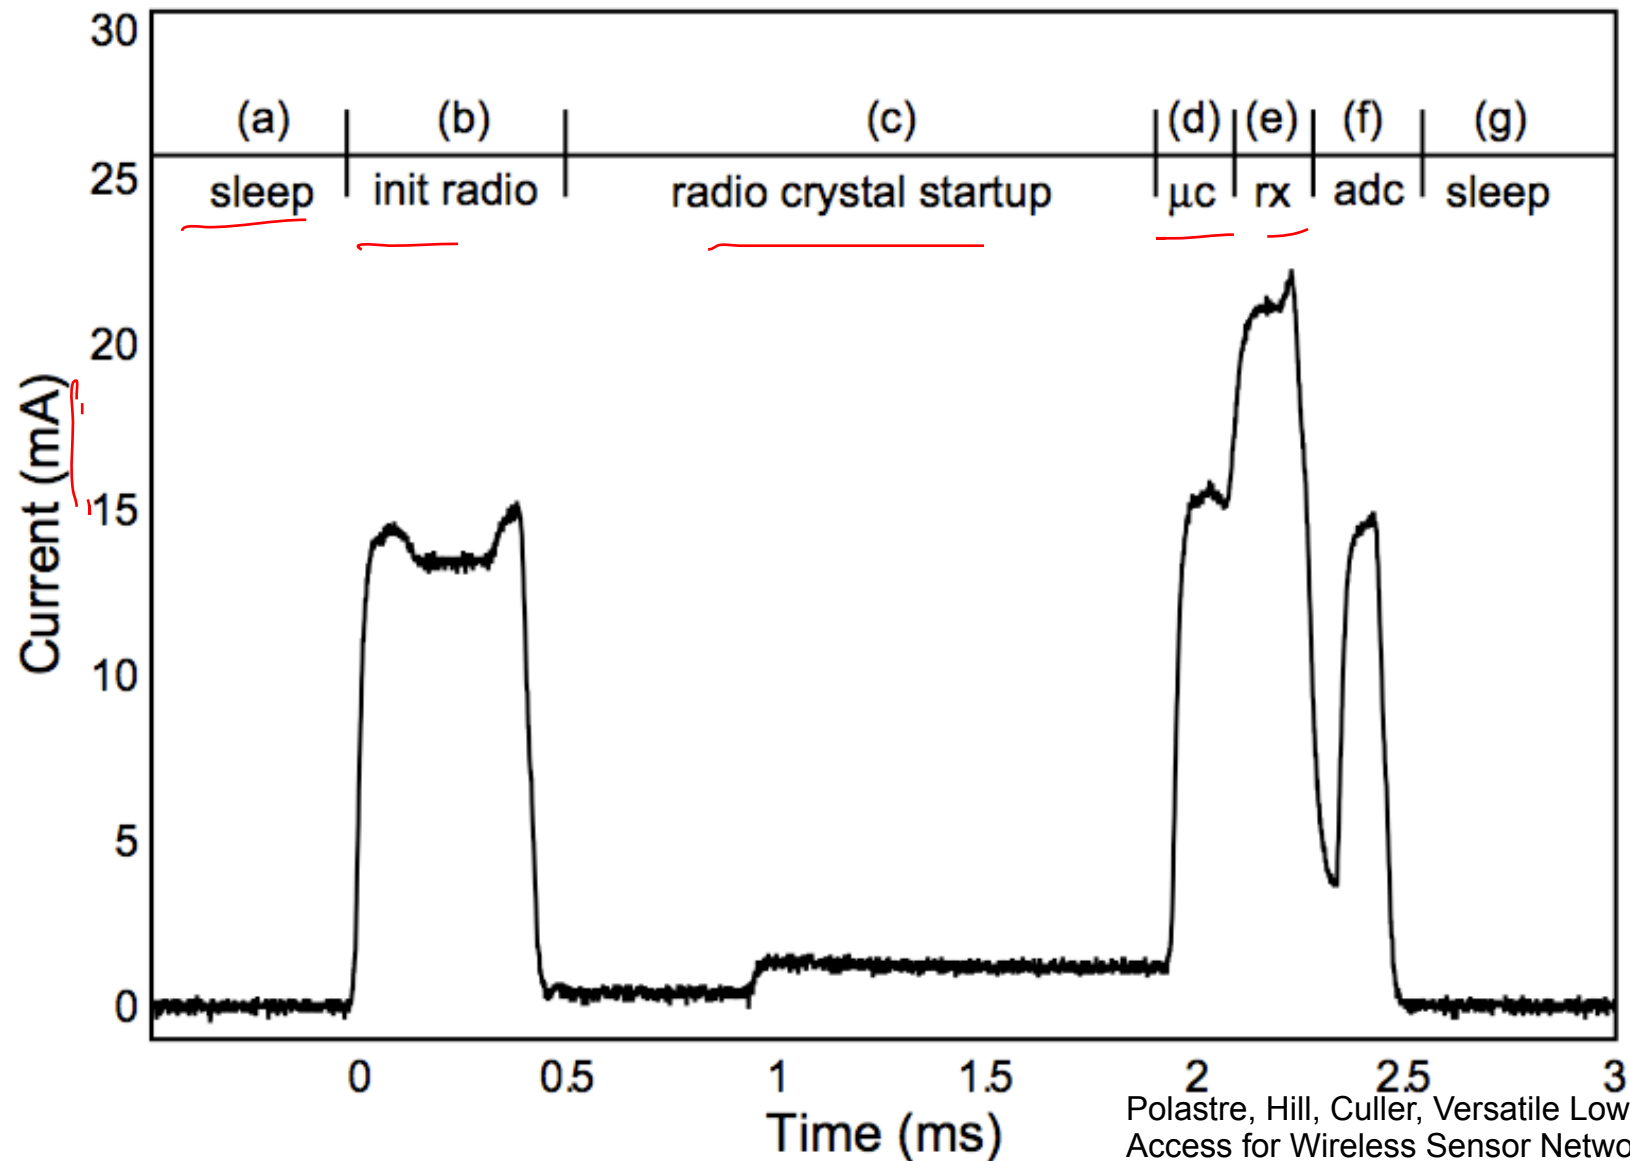

► optional

- RTS / CTS
- Acknowledgments

► De-facto standard for WSN MAC Protocols

Low Power Listening

Polastre, Hill, Culler, Versatile Low Power Media Access for Wireless Sensor Networks, SenSys'04

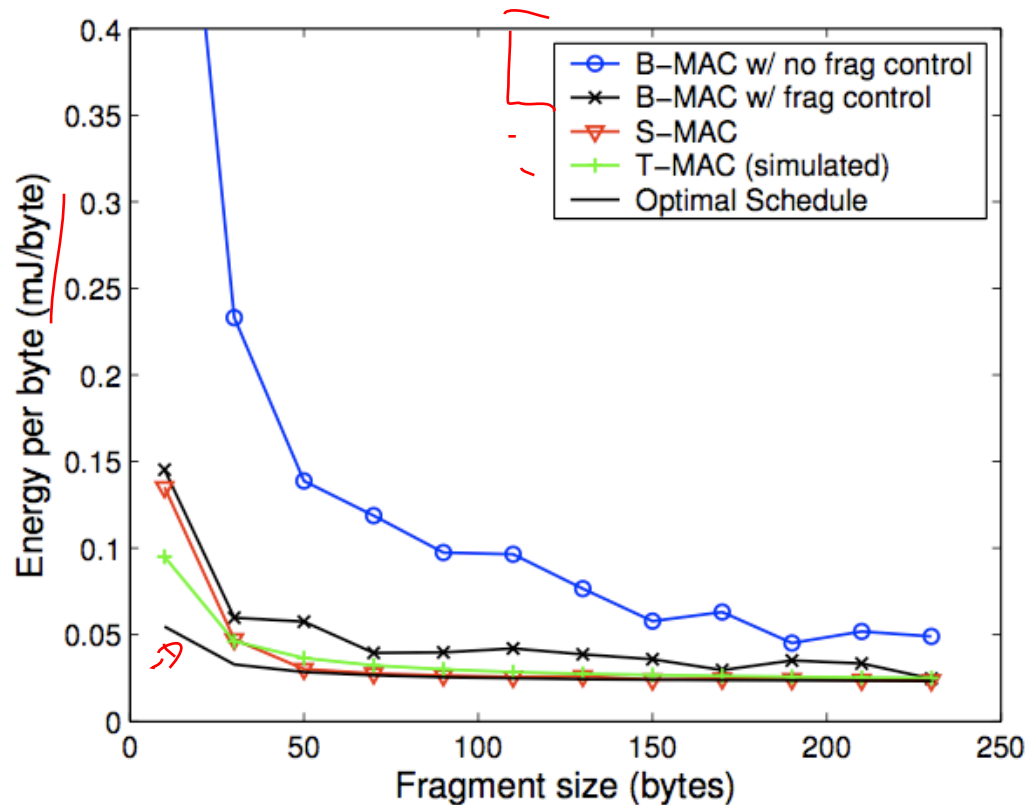

Memory Consumption B-MAC and S-MAC

Byte

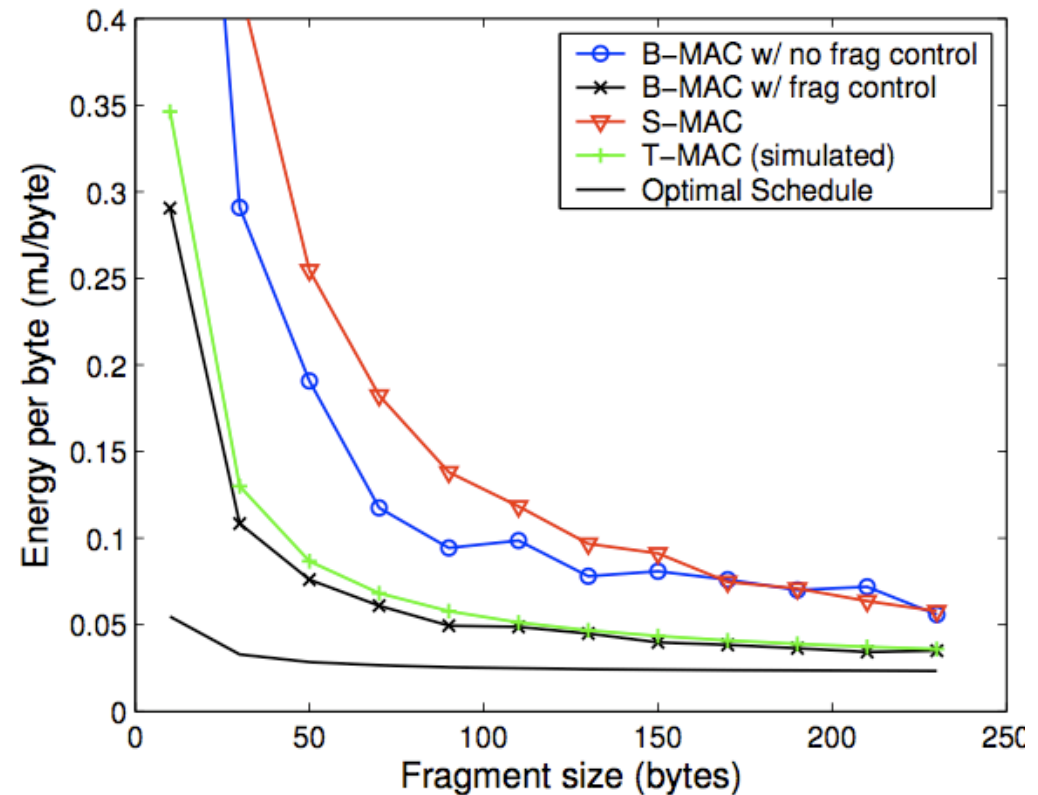

Protocol	ROM	RAM
B-MAC	3046	166

Outlook MAC in WSN

- ▶ **Many other protocols in WSN**
 - LEACH, TRAMA, PAMAS, SMACS, ...
- ▶ **Very large diversity of protocols**
 - very simple and very complex protocols
 - very specialized for certain hardware or not at all
 - TDMA, CDMA, clustering, multi-hop, single-hop, ...
- ▶ **Further reading**
