# Algorithms for Radio Networks

## Introduction and Basics

University of Freiburg  
Institute of Computer Science  
Computer Networks and Telematics  
Christian Schindelhauer

# Networks Types

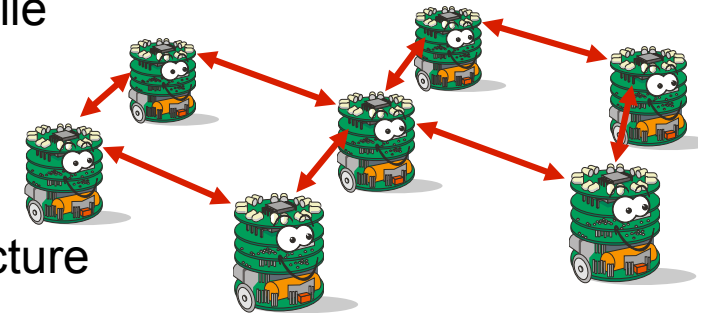

## ► Cellular networks

- one or more access stations
- each access station covers a cell
- e.g. mobile telephones, WLAN

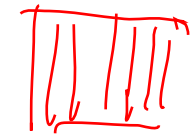

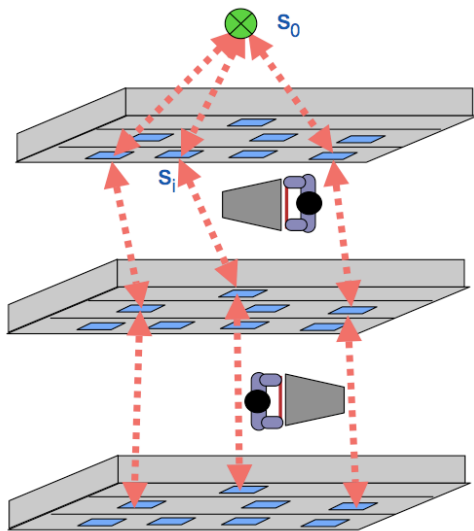

## ► Mobile ad hoc networks

- self-configuring network of mobile nodes
- nodes serve as end-points or routers
- without any dedicated infrastructure

## ► Wireless sensor network

- connecting sensors and actuator units wireless communicating with one or more base stations
- base station is more powerful than other nodes

# Popular Wireless Networks

## 0 ▶ GSM, GPRS, EDGE

- Global System for Mobile Communications
- General Packet Radio Service
- Enhanced Data Rates for GSM Evolution
- 0 • Smart phones, PDAs, Laptop/netbook modem, Tablet PCs

## 0 ▶ UMTS

- Universal Mobile Telecommunications Systems
- 3rd generation mobile communication standard

## 6 ▶ LTE

- Long Term Evolution
- 4th generation standard

## 0 ▶ IEEE 802.11 a/b/g/n/ac . . .

- Wireless Local Area Network (WLAN)
- Wireless networking of computers, cameras, printers, etc.
- Mostly as cellular networks
- But also allows ad-hoc mode between two nodes

## 0 ▶ IEEE 802.15.4 + Zigbee

- Wireless Personal Area Network (WPAN)
  - Standard for wireless sensor networks
  - Zigbee Alliance
    - \* defined higher protocol layers

# ISO/OSI Reference model

## 7. Application

- Data transmission, e-mail, terminal, remote login

## 6. Presentation

- System-dependent presentation of the data (EBCDIC / ASCII)

## 5. Session

- start, end, restart

## 4. Transport

- Segmentation, congestion

## 3. Network

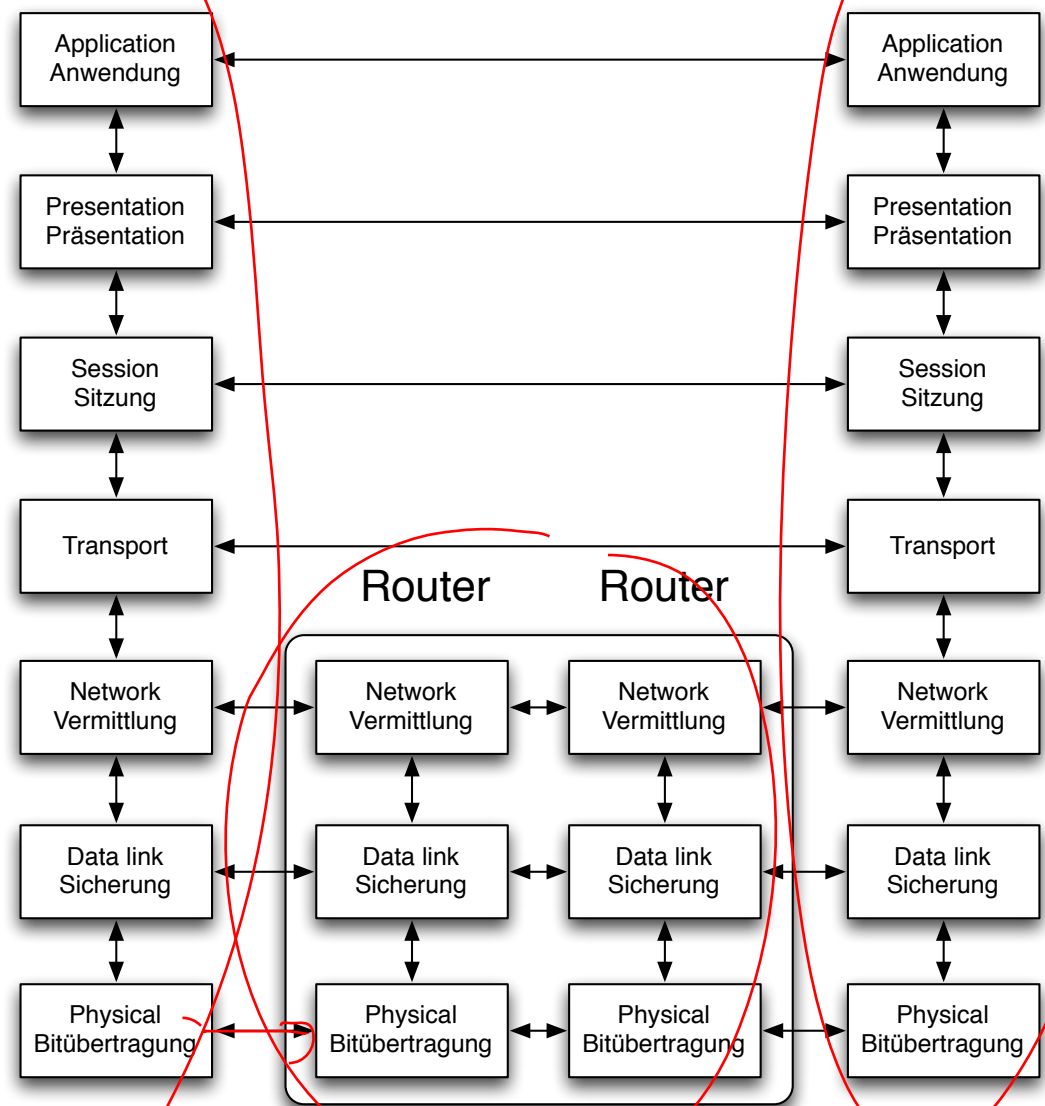

- Routing

## 2. Data Link

- Checksums, flow control

## 1. Physical

- Mechanics, electrics

# TCP/IP-Layer of the Internet

|                 |   |
|-----------------|---|
| Application     | Telnet, FTP, HTTP, SMTP (E-Mail), ...   |
| Transport       | TCP (Transmission Control Protocol)<br>UDP (User Datagram Protocol)   |
| Network         | IP (Internet Protocol)<br>+ ICMP (Internet Control Message Protocol)<br>+ IGMP (Internet Group Management Protocol) |
| Host-to-Network | LAN (e.g. Ethernet, 802.11n etc.)   |

# Signals, Data and Information

## Information

- Human interpretation,
- e.g. Beautiful weather

## Data

- Formal presentation
- e.g. ~~28~~ degrees Celsius, rainfall 0cm, ~~0%~~ cloud cover

50%

## Signal <sup>16</sup>

- Representation of data by physical variables,
- e.g. Current flow through thermal sensor, the video signals from camera

## Examples of signals:

- Current, voltage
- In the digital world signals representing bits

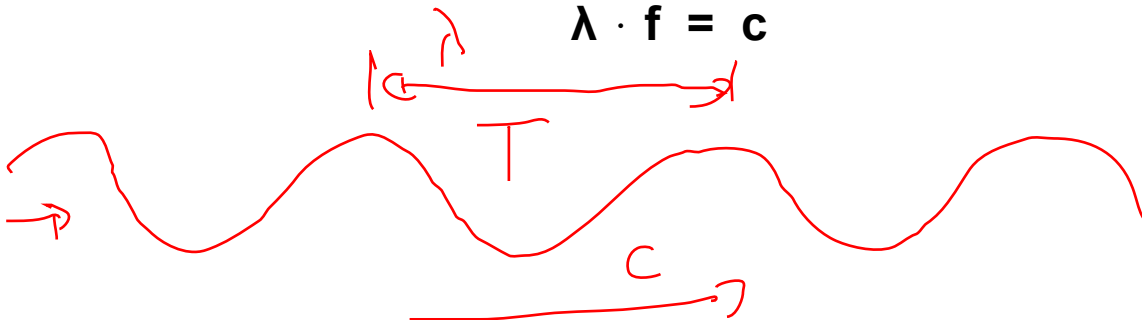

# Physics – Background

## ► Moving particles with electric charge cause electromagnetic waves

- frequency  $f$  : number of oscillations per second
  - unit: Hertz
- wavelength  $\lambda$ : distance (in meters) between two wave maxima
- antennas can create and receive electromagnetic waves
- the transmission speed of electromagnetic waves in vacuum is constant
- speed of light  $c \approx 3 \cdot 10^8$  m/s

## ► Relation between wavelength, frequency and speed of light:

$$\lambda \cdot f = c$$

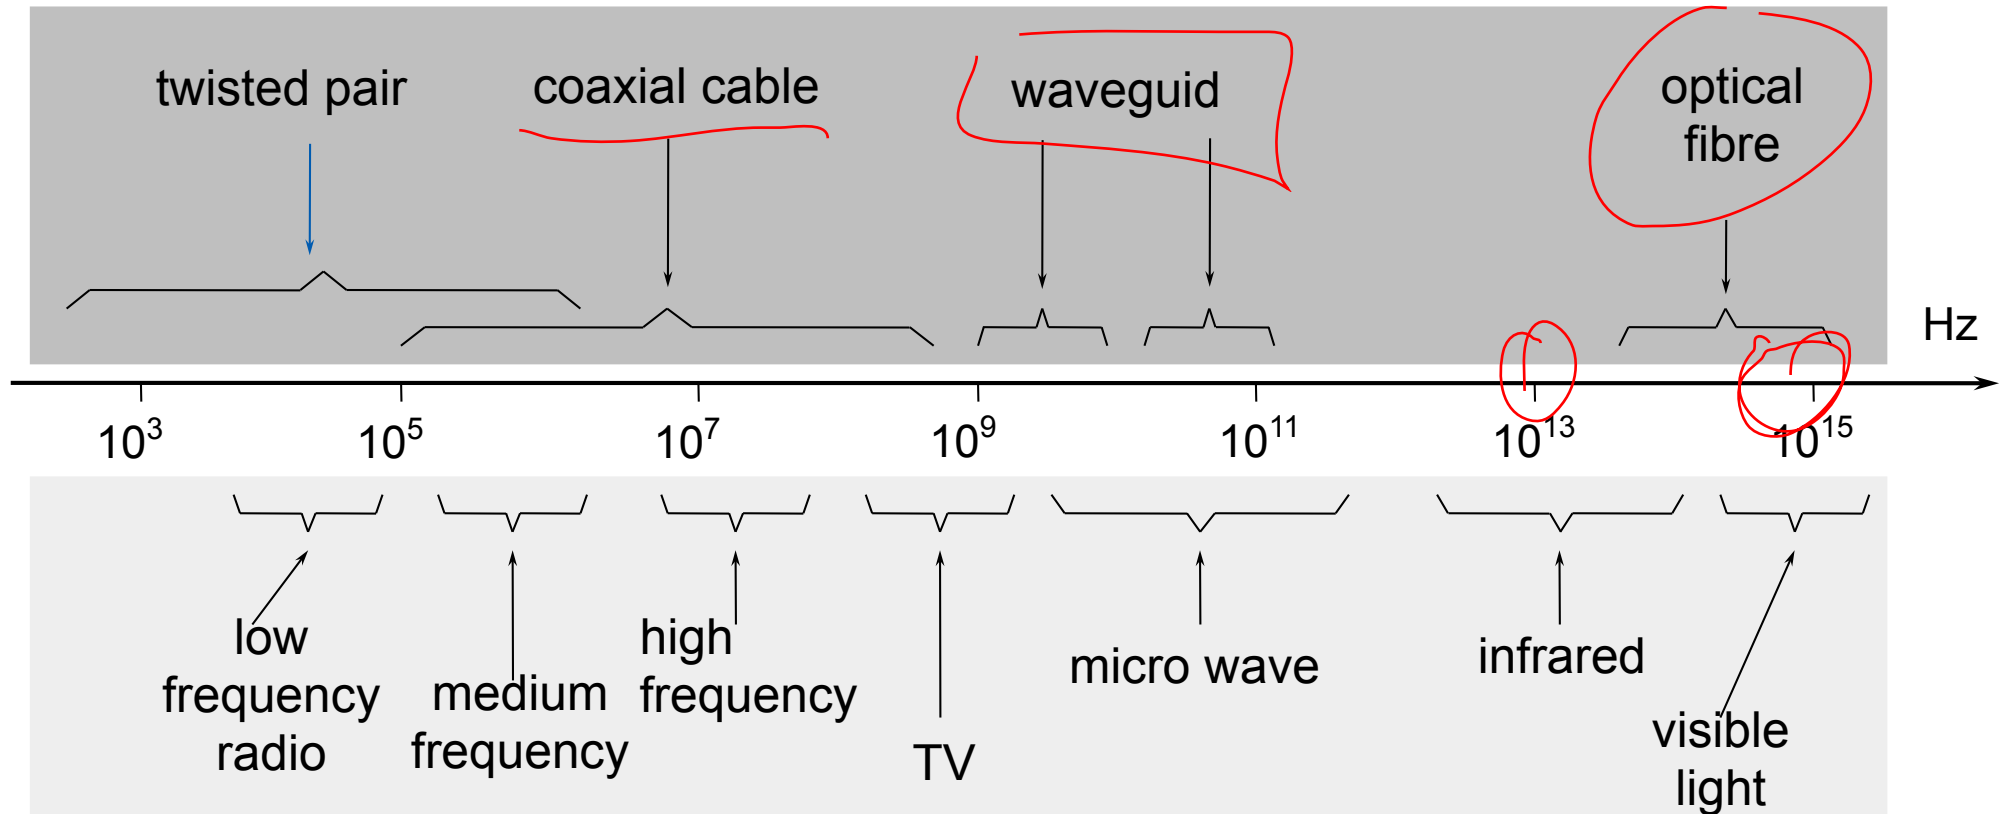

$$c = \frac{\lambda}{T}$$
$$c = \lambda \cdot f$$

$$T = \frac{1}{f}$$

# Electromagnetic Spectrum

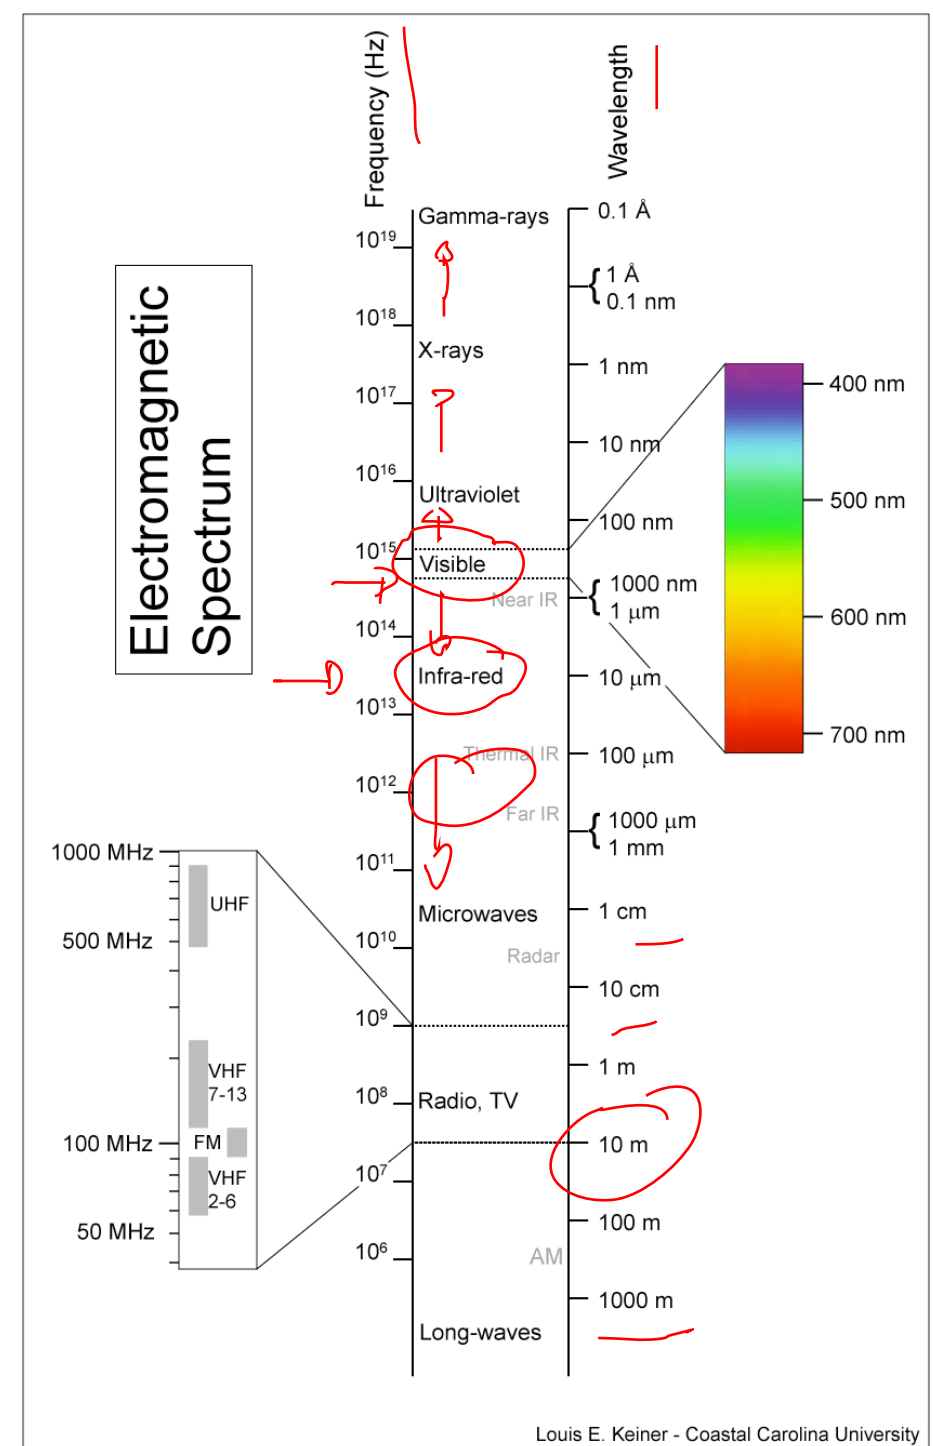

guided media

guided media

# Bands

- **LF**      **Low Frequency**
- **MF**      **Medium Frequency**
- **HF**      **High Frequency**
- **VHF**     **Very High Frequency**
- **UHF**     **Ultra High Frequency**
- **UV**      **Ultra Violet light**

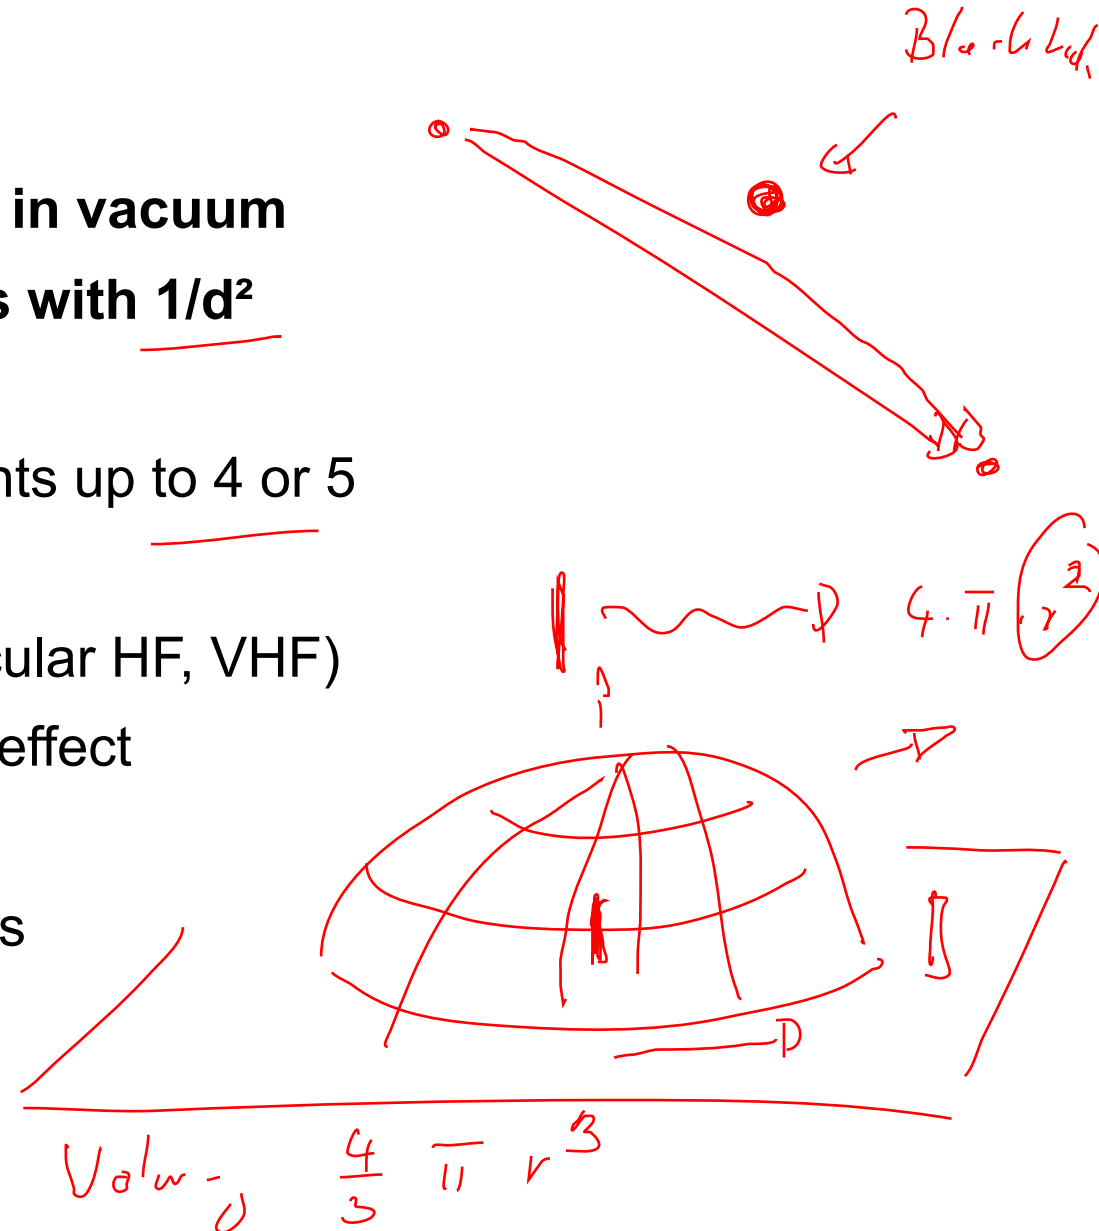

Louis E. Keiner - Coastal Carolina University

# Bands for Wireless Networks

- ▶ VHF/UHF for mobile radio
  - antenna length
- ▶ SHF for point-to-point radio systems, satellite communication
- ▶ Wireless LAN: UHF to SHF
  - planned EHF
- ▶ Visible light
  - communication by laser
- ▶ Infrared
  - remote controls
  - LAN in closed rooms

# Propagation Performance

- ▶ **Straight-lined propagation in vacuum**
- ▶ **Received power decreases with  $1/d^2$** 
  - in theory
  - in practice higher exponents up to 4 or 5
- ▶ **Reduction because of**
  - attenuation in air (in particular HF, VHF)
  - shadowing and mountain effect
  - reflection
  - diffusion at small obstacles
  - diffraction

# Frequency Dependent Behavior

## ▶ VLF, LF, MF

- follow the curvature of the earth (up to 1000 km for VLF)
- permeate buildings

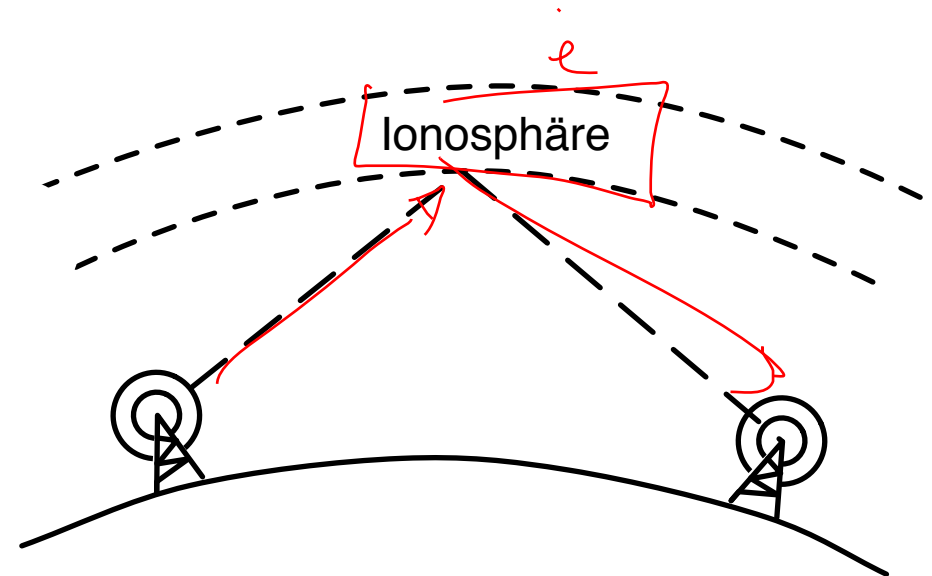

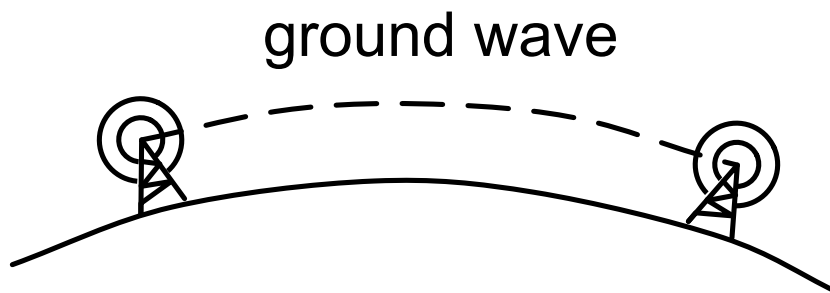

## ▶ HF, VHF

- absorbed by the ground
- reflected by the ionosphere 100-500 km height

## ▶ Over 100 MHz

- straight-line propagation
- marginal penetration of buildings
- good focus

## ▶ Over 8 GHz absorption by rainfall

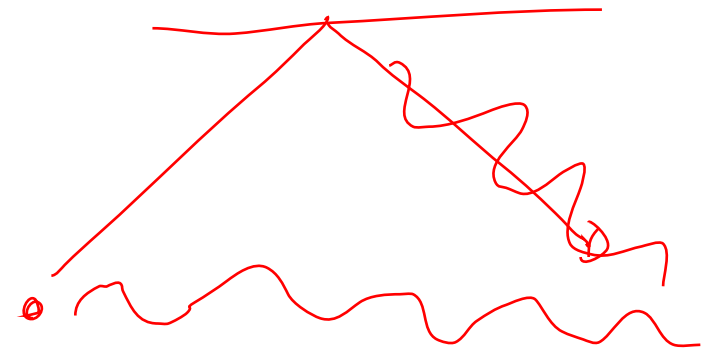

# Problems

## ► Multiple Path Fading

- Signal arrives at receiver on multiple paths because of reflection, diffusion, and diffraction
- Signal time variation leads to interferences
  - decoding faults
  - attenuation

## ► Mobility problems

- Fast fading
  - different transmission paths
  - different phasing
- Slow fading
  - increase of distance between sender and receiver

# Noise and Interference

## ▶ Noise

- inaccuracies and heat development in electrical components
- modeled by normal distribution

## ▶ Interference from other transmitters

- in the same spectrum
- or in neighbored spectrum
  - e.g. because of bad filters

## ⑥ ▶ **Effect**

- Signal is disrupted

# Signal Interference Noise Ratio

► reception energy = transmission energy · path loss

- path loss  $\sim 1/d^\gamma$

- $\gamma \in [2,5]$

► Signal to Interference and Noise Ratio = SINR

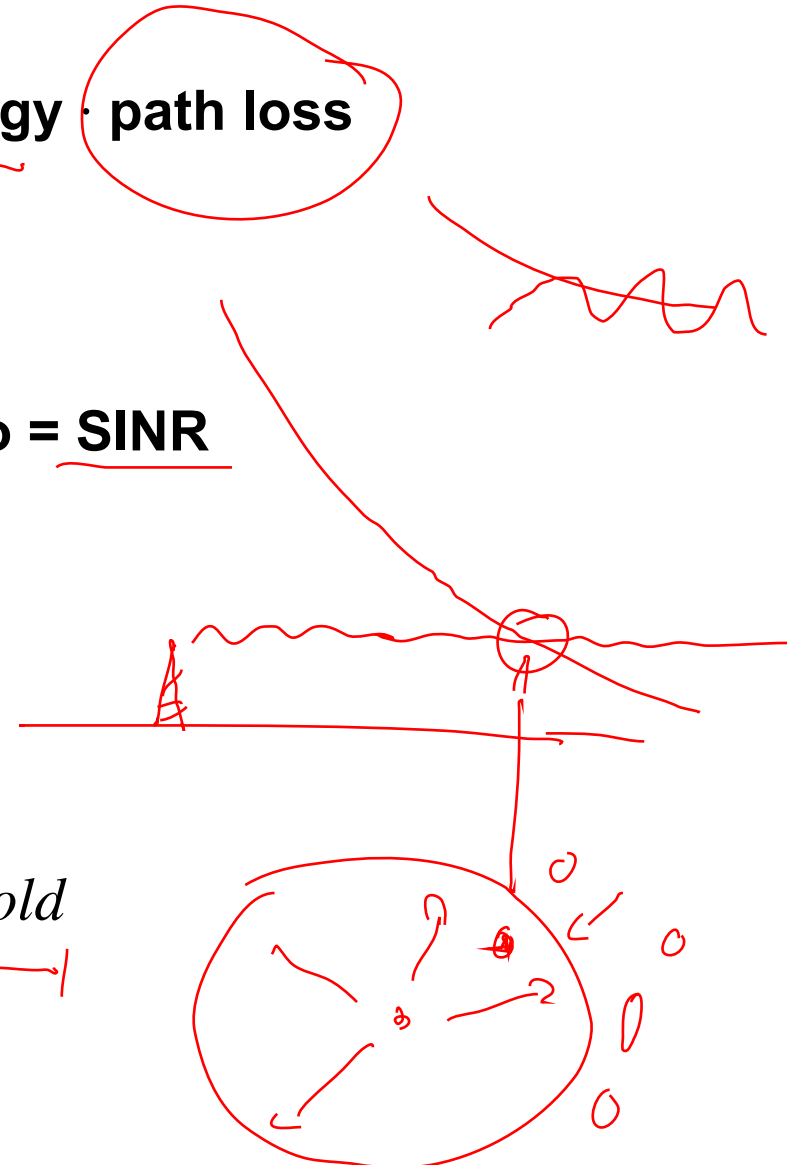

- $S$  = (desired) Signal energy

- $I$  = energy of Interfering signals

- $N$  = Noise

► Necessary condition for reception

$$\boxed{\text{SINR}} = \frac{S}{I + N} \geq \text{Threshold}$$

# Path Loss

## ► Attenuation

- Received signal power depends on the distance  $d$  between sender and receiver

## ► Friis transmission equation

- distance:  $R$
- wavelength:  $\lambda$
- $P_r$ : energy at receiver antenna
- $P_t$ : energy at sender antenna
- $G_t$ : sender antenna gain
- $G_r$ : receiver antenna gain

$$\frac{P_r}{P_t} = G_t G_r \left( \frac{\lambda}{4\pi R} \right)^2$$

$$P_r(d) = P_r(d_0) \cdot \left( \frac{d_0}{d} \right)^2$$

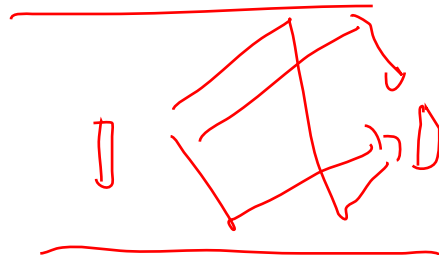

# Path Loss Exponent

## ► Measurements

- $\gamma$  path loss exponent
- shadowing variance  $\sigma^2$
- reference path loss at 1m distance

| Location             | Average of $\gamma$ | Average of $\sigma^2$ [dB] | Range of PL(1m) [dB] |
|----------------------|---------------------|----------------------------|----------------------|
| Engineering Building | 1.9                 | 5.7                        | [−50.5, −39.0]       |
| Apartment Hallway    | 2.0                 | 8.0                        | [−38.2, −35.0]       |
| Parking Structure    | 3.0                 | 7.9                        | [−36.0, −32.7]       |
| One-sided Corridor   | 1.9                 | 8.0                        | [−44.2, −33.5]       |
| One-sided patio      | 3.2                 | 3.7                        | [−39.0, −34.2]       |
| Concrete canyon      | 2.7                 | 10.2                       | [−48.7, −44.0]       |
| Plant fence          | 4.9                 | 9.4                        | [−38.2, −34.5]       |
| Small boulders       | 3.5                 | 12.8                       | [−41.5, −37.2]       |
| Sandy flat beach     | 4.2                 | 4.0                        | [−40.8, −37.5]       |
| Dense bamboo         | 5.0                 | 11.6                       | [−38.2, −35.2]       |
| Dry tall underbrush  | 3.6                 | 8.4                        | [−36.4, −33.2]       |
